Software Engineer, Co-op (Data Focused) – Spring 2027

Dear Klue Engineering Hiring Team,

As a third-year Software Systems student at Simon Fraser University and an Integrations Intern at Everbridge, I have learned that building software is not just about making a feature work once. It is about handling different inputs, testing unexpected conditions, and making sure the system remains reliable as changes are made. Klue's Software Engineer Co-op role interests me because it applies that same approach to AI-powered features, backend services, and data processing.

At Everbridge, I develop workflow integration steps across Everbridge and xMatters, connecting external services including Microsoft Teams, Jira Cloud, Dynatrace, Salesforce, and BMC Control-M. I work with Python and APIs to define inputs and outputs, handle errors and edge cases, and write automated tests for changes. I also use Jenkins CI/CD pipelines during release preparation and create technical documentation for integration behaviour. This work has made me comfortable working with external systems, investigating failures systematically, and maintaining existing functionality while adding new features.

My project work has strengthened my backend development and AI foundation. I built SmarterAI with a Python FastAPI backend and Google Gemini API integration, using request validation and error handling to make responses predictable. For Love At First Paw, I worked in a 4-member team to integrate external APIs and test the application with Jest and Playwright. We deployed through Vercel with CI/CD pipelines and achieved over 95% deployment success. I have also worked with SQL and relational database design through my Library Database System project.

I believe my experience with Python, APIs, automated testing, and backend development would be useful to Klue's engineering team. I am also interested in learning more about how Klue builds and maintains AI services in production. I would appreciate the opportunity to discuss how I could contribute.

Sincerely,
Pan Phoo Eain
